Congratulations on purchasing a Stephen M. Boone mini-plane. Luthier Suppliers is proud of this plane and happy that it will help you in your woodworking.

The blade is supplied razor sharp and ready for use.

Adjustment of the depth of cut is simple. Remove the wedge and the blade. This is done by gently pulling the wedge out of the body. Make sure the blade does not fall out unexpectedly. Place the plane on a flat wood surface. For a shallow cut place a single sheet of paper under the leading edge of the plane. Replace the blade with the bevel down. This makes the cutting edge very close to the front of the mouth of the plane. Make sure the blade is seated flat in the bed and then gently but firmly replace the wedge. The plane is ready to use. I find that this is the only depth setting that I need. If you want a deeper cut you can use a business card instead of a single sheet of paper.

You will notice that the sides of the plane are beveled. This allows you to use the plane at about a 45 degree angle for trimming braces very close to the top. I find this feature really helps in shaping braces.
